What is Household Air Quality?

Development Countries
Household air pollution is one of the most important causes of poor health in developing countries.

Women & Children
Particularly for women and children, who are most impacted by household air quality, it's the second most important risk factor for women and girls.

How is the world doing?
The number of people using solid fuel as cooking fuel has increased greatly. The absolute number of people using solid fuels has roughly doubled from 333 to 646 million from 1989 to 2010.

Although biomass fuels contain few actual contaminants, they produce substantial pollution mainly as a result of incomplete combustion in traditional stoves and open fires. Unfortunately, since people in developing countries range from access to advanced stoves, cooking with biomass exposes them to harmful pollutants.
